March 2016

# Understanding systemd

**Presented By**

Christoph Doebeck  
Principal Solutions Architect  
Red Hat

**Additional Credits**

Patrick Ladd / Red Hat (TAM)

# What is systemd?

- Replaces init
  - Literally!

```
[root@rhel7 ~]# ls -al /sbin/init
lrwxrwxrwx. 1 root root 22 Jan 27 13:43 /sbin/init -> ../lib/systemd/systemd
[root@rhel7 ~]#
```

- First process to start and last to stop
- Parent process of all other processes
- Manages services *and* other resources

# What was init again?

- init – System V UNIX origins in 1970s
- Process for starting system:
  - BIOS/UEFI → Bootloader → Kernel → init
- init is the parent of all processes
- Creates processes from scripts stored in `/etc/inittab`
- “Modern” init scripts are stored in `/etc/init.d` and called from `/etc/rc*`

# Why replace System V init?

- init scripts!
  - Old, poorly maintained
  - Lack of standardization
  - Difficult / impossible to analyze (by humans and/or computers)
- Single threaded
- Unable to represent complex relationships

# /etc/init.d/httpd

(taken from RHEL 6.5, comments removed)

```
. /etc/rc.d/init.d/functions
if [ -f /etc/sysconfig/httpd ]; then
    . /etc/sysconfig/httpd
fi
HTTPD_LANG=${HTTPD_LANG-"C"}
INITLOG_ARGS=""
apachectl=/usr/sbin/apachectl
httpd=${HTTPD-/usr/sbin/httpd}
prog=httpd
pidfile=${PIDFILE-/var/run/httpd/httpd.pid}
lockfile=${LOCKFILE-/var/lock/subsys/httpd}
RETVAL=0
STOP_TIMEOUT=${STOP_TIMEOUT-10}
start() {
    echo -n $"Starting $prog: "
    LANG=$HTTPD_LANG daemon --pidfile=${pidfile} $httpd $OPTIONS
    RETVAL=$?
    echo
    [ $RETVAL = 0 ] && touch ${lockfile}
    return $RETVAL
}
stop() {
    echo -n $"Stopping $prog: "
    killproc -p ${pidfile} -d ${STOP_TIMEOUT} $httpd
    RETVAL=$?
    echo
    [ $RETVAL = 0 ] && rm -f ${lockfile} ${pidfile}
}
}
```

# /etc/init.d/httpd

(continued)

```
reload() {
    echo -n $"Reloading $prog: "
    if ! LANG=$HTTPD_LANG $httpd $OPTIONS -t >&/dev/null; then
        RETVAL=6
        echo $"not reloading due to configuration syntax error"
        failure $"not reloading $httpd due to configuration syntax error"
    else
        LSB=1 killproc -p ${pidfile} $httpd -HUP
        RETVAL=$?
        if [ $RETVAL -eq 7 ]; then
            failure $"httpd shutdown"
        fi
    fi
    echo
}
```

```
case "$1" in
    start)
        start
        ;;
    stop)
        stop
        ;;
    status)
        status -p ${pidfile} $httpd
        RETVAL=$?
        ;;

```

# /etc/init.d/httpd

(still continued...)

```
restart)
    stop
    start
    ;;
condrestart|try-restart)
    if status -p ${pidfile} $httpd >&/dev/null; then
        stop
        start
    fi
    ;;
force-reload|reload)
    reload
    ;;
graceful|help|configtest|fullstatus)
    $apachectl $@
    RETVAL=$?
    ;;
*)
    echo $"Usage: $prog
{start|stop|restart|condrestart|try-restart|force-reload|reload|status|fullstatus|graceful|help|configtest}"
    RETVAL=2
esac
exit $RETVAL
```

# systemd: httpd.service

## [Unit]

Description=The Apache HTTP Server  
After=remote-fs.target nss-lookup.target

## [Service]

Type=notify  
EnvironmentFile=/etc/sysconfig/httpd  
ExecStart=/usr/sbin/httpd \$OPTIONS -DFOREGROUND  
ExecReload=/usr/sbin/httpd \$OPTIONS -k graceful  
ExecStop=/usr/sbin/httpd \$OPTIONS -k graceful-stop

KillSignal=SIGCONT  
PrivateTmp=true

## [Install]

WantedBy=multi-user.target

So long, and thanks for all the fish

# Adoption

- Default init in
  - Fedora 15 – May 2011
  - Arch – October 2012
  - Red Hat – June 2014
  - SUSE – October 2014
  - Ubuntu & Debian – April 2015

# systemd - System & Service Manager

# systemd Overview

- Controls More than Services
- Dependency Control
- Tracks and Restarts Services
- Service Activation
- Faster Start Up and Shutdown
- Improved Resource Management
- Better Logging, Debugging and Profiling
- Backwards compatible
- Easier to learn

# systemd Units

Controls more than services, it controls all resources on the system - referred to as units.

Examples of Units:

Services	Sockets	Mounts
Targets	Swap	and more...

Units are defined using Unit Files

- Naming convention is name.unit\_type

# systemd Unit Files

- Maintainer files: `/usr/lib/systemd/system`
- Administrator files: `/etc/systemd/system`
- Non-persistent, runtime data: `/run/systemd`
- Drop-ins: `/etc/systemd/system/[name.type].d/*.conf`

**Note:** unit files under `/etc` will take precedence over `/usr`

Don't forget `systemctl daemon-reload` when modifying units.

# Common Unit File Options

Description=Unit description

Documentation=Documentation links

Requires=Additional units required

Before/After=Unit must start Before/After

Wants=Weaker Requires

Conflicts=Units cannot co-exist

WantedBy/RequiredBy=Set other units requirement

- Lots of great detail in the [RHEL 7 System Administrator's Guide](#)

# Service Activation

- Start up services when needed
  - Save resources
  - Increased reliability
  - Transparent to client
- Activation by Socket, Device, Path, Bus, and Timer
- Recommended to convert xinetd services to units

# Improved Resource Management

- Services labeled and isolated with Cgroups
- More control than nice alone
- Can properly kill/restart entire service chain
- Can configure multiple instances for a single service
- Can balance by shares or by hard limits

# Kill/Restart Cleanly

- Tracked in the kernel
- Knows all children
- Don't need to rely on a potentially misbehaving process to hopefully kill its children

# Auto-Restarting

- It's paying attention!
- Reality: software does crash occasionally
- Reduces need for manual intervention
- Socket stays open, only lose that single transaction

# systemd: Managing Services

With init:

```
$ service unit {start,stop,restart,reload}
```

With systemd:

```
$ systemctl {start,stop,restart,reload} unit1 [unit2 ...]
```

- Allows multiple services to be acted on simultaneously
- Assumes `.service` as unit type
- Tab completion works great with `systemctl`
  - Install bash-completion

# systemctl vs service

# systemctl vs service

- List services:

```
[root@rhel6 ~]# service --status-all
abrt-ccpp hook is installed
abrt-d (pid 1652) is running...
abrt-dump-oops is stopped
acpid (pid 1440) is running...
atd (pid 1675) is running...
auditd (pid 1106) is running...
automount (pid 1518) is running...
certmonger (pid 1704) is running...
Stopped
cgred is stopped
```

```
[root@rhel7 ~]# systemctl --type service --state active
```

UNIT	LOAD	ACTIVE	SUB	DESCRIPTION
abrt-ccpp.service	loaded	active	exited	Install ABRT coredump hook
abrt-oops.service	loaded	active	running	ABRT kernel log watcher
abrt-xorg.service	loaded	active	running	ABRT Xorg log watcher
abrt-d.service	loaded	active	running	ABRT Automated Bug Reporting
accounts-daemon.service	loaded	active	running	Accounts Service
alsa-state.service	loaded	active	running	Manage Sound Card State (res

# Managing Services: Enable / Disable

With init:

```
$ chkconfig unit {on,off}
```

With systemctl:

```
$ systemctl {enable, disable, mask, unmask} unit [unit...]
```

**mask** – “This will link these units to `/dev/null`, making it impossible to start them. This is a stronger version of `disable`, since it prohibits all kinds of activation of the unit, including manual activation. Use this option with care.”

# Systemctl vs chkconfig

List all services:

```
[root@rhel6 ~]# chkconfig --list
abrt-ccpp      0:off  1:off  2:off  3:on   4:off  5:on   6:off
abrt-d        0:off  1:off  2:off  3:on   4:off  5:on   6:off
acpid         0:off  1:off  2:on   3:on   4:on   5:on   6:off
atd           0:off  1:off  2:off  3:on   4:on   5:on   6:off
auditd       0:off  1:off  2:on   3:on   4:on   5:on   6:off
autofs       0:off  1:off  2:off  3:on   4:on   5:on   6:off
blk-availability 0:off  1:on   2:on   3:on   4:on   5:on   6:off
certmonger   0:off  1:off  2:off  3:on   4:on   5:on   6:off
```

```
[root@rhel7 ~]# systemctl list-unit-files --type=service
UNIT FILE                                     STATE
abrt-ccpp.service                            enabled
abrt-oops.service                            enabled
abrt-pstoreoops.service                      disabled
abrt-vmcore.service                          enabled
abrt-xorg.service                            enabled
abrt-d.service                               enabled

```

# systemctl

Lots of options...

```
[root@rhel7 ~]# systemctl
cancel                is-active            reload-or-restart
condreload           is-enabled           reload-or-try-restart
condrestart          is-failed           rescue
condstop            isolate             reset-failed
daemon-reexec       kexec              restart
daemon-reload       kill               set-default
default             link              set-environment
delete             list-dependencies  set-property
disable            list-jobs          show
emergency          list-sockets       show-environment
enable            list-unit-files    snapshot
exit              list-units         start
force-reload       mask              status
get-default        poweroff          stop
halt              preset           suspend
help             reboot          try-restart
hibernate         reenable         unmask
hybrid-sleep      reload          unset-environment
```

# systemd-\*

Lots of new commands...

```
[root@rhel7 ~]# systemd-
systemd-analyze                systemd-logindctl
systemd-ask-password           systemd-machine-id-setup
systemd-cat                     systemd-notify
systemd-cgls                   systemd-nspawn
systemd-cgtop                  systemd-run
systemd-coredumpctl            systemd-stdio-bridge
systemd-delta                  systemd-sysv-convert
systemd-detect-virt            systemd-tmpfiles
systemd-inhibit                systemd-tty-ask-password-agent
```

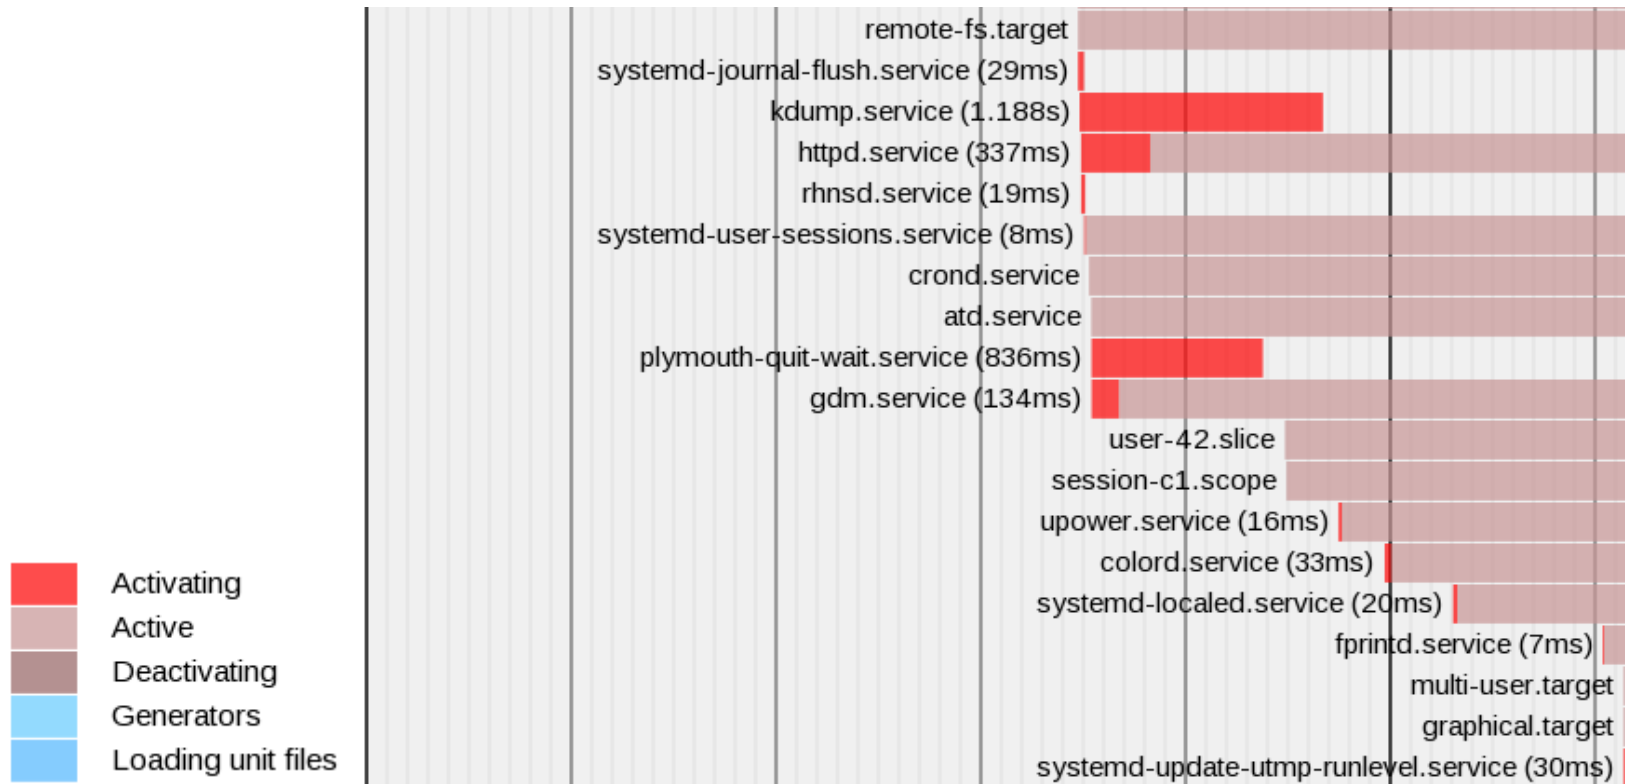

# systemd Dependencies

- Define order and requirements for each unit
- Example: `nfs-lock.service`
  - Requires=`rpcbind.service network.target`
  - After=`network.target named.service rpcbind.service`
  - Before=`remote-fs-pre.target`
- No more semi-arbitrary 00-99 ASCII order loading

# Parallel, Not Serial

- Allows for Faster Start Up and Shutdown
- Efficiently Use System Resources

```
[root@rhel7 ~]# systemd-analyze plot > /tmp/boot_plot.svg
```

# Boot Process

- Boot path determined by default.target

Let's track it backwards!

```
[root@rhel7 ~]# systemctl get-default  
graphical.target
```

```
[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/graphical.target  
  
[Unit]  
Description=Graphical Interface  
Documentation=man:systemd.special(7)  
Requires=multi-user.target  
After=multi-user.target  
Conflicts=rescue.target  
Wants=display-manager.service  
AllowIsolate=yes
```

# Boot Process

- graphical.target requires multi-user.target...

```
[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/multi-user.target

[Unit]
Description=Multi-User System
Documentation=man:systemd.special(7)
Requires=basic.target
Conflicts=rescue.service rescue.target
After=basic.target rescue.service rescue.target
AllowIsolate=yes
```

# Boot Process

- Which requires basic.target...

```
[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/basic.target

[Unit]
Description=Basic System
Documentation=man:systemd.special(7)
Requires=sysinit.target
Wants=sockets.target timers.target paths.target slices.target
After=sysinit.target sockets.target timers.target paths.target slices.target
```

- Which requires sysinit.target...

```
[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/sysinit.target

[Unit]
Description=System Initialization
Documentation=man:systemd.special(7)
Conflicts=emergency.service emergency.target
Wants=local-fs.target swap.target
After=local-fs.target swap.target emergency.service emergency.target
```

# Boot Process

Which wants local-fs-pre.target and swap.target...

```
[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/local-fs-pre.target  
  
[Unit]  
Description=Local File Systems (Pre)  
Documentation=man:systemd.special(7)  
RefuseManualStart=yes  
[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/swap.target  
  
[Unit]  
Description=Swap  
Documentation=man:systemd.special(7)  
[root@rhel7 ~]#
```

- End of the line!

# Boot Process

Targets then loaded from the beginning..

But, how does this work for starting individual services?

# Boot Process – Services/Units

- Target “Wants” Directories:

`/usr/lib/systemd/system/<name>.target.wants/`

`/etc/systemd/system/<name>.target.wants/`

- Files are symlinks to actual unit files
- Empty target wants directories are placeholders

# Boot Process - Services/Units

Example for multi-user.target.wants:

```
[root@rhel7 ~]# ls /usr/lib/systemd/system/multi-user.target.wants
brandbot.path    plymouth-quit.service          systemd-logind.service
dbus.service     plymouth-quit-wait.service     systemd-user-sessions.service
getty.target     systemd-ask-password-wall.path
[root@rhel7 ~]# ls /etc/systemd/system/multi-user.target.wants
abrt-ccpp.service    hypervkvpd.service             postfix.service
abrt-d.service       hypervvssd.service            remote-fs.target
abrt-oops.service    irqbalance.service            rhsmcertd.service
abrt-vmcore.service  kdump.service                 rngd.service
abrt-xorg.service    ksm.service                   rsyslog.service
atd.service          ksmtuned.service              smartd.service
auditd.service       libstoragemgmt.service        sshd.service
avahi-daemon.service libvirtd.service              sysstat.service
chronyd.service      mariadb.service               tuned.service
crond.service        mdmonitor.service             vmtoltd.service
cups.path            ModemManager.service
httpd.service        NetworkManager.service
```

# Exploring dependencies

List all services by target:

```
[root@rhel7 ~]# systemctl list-dependencies multi-user.target --no-pager
multi-user.target
├─abrt-ccpp.service
├─abrt-oops.service
├─abrt-vmcore.service
├─basic.target
│   ├─alsa-restore.service
│   ├─alsa-state.service
│   ├─paths.target
│   ├─slices.target
│   │   └─.slice
│   │       └─system.slice
│   └─sockets.target
│       ├─avahi-daemon.socket
│       └─cups.socket
├─timers.target
│   └─systemd-tmpfiles-clean.timer
├─getty.target
│   └─getty@tty1.service
└─remote-fs.target
```

# Analyzing Boot

- Each unit is tracked during start up

```
[root@rhel7 ~]# systemd-analyze blame --no-pager
2.598s mariadb.service
1.459s kdump.service
868ms plymouth-quit-wait.service
867ms postfix.service
510ms firewalld.service
397ms network.service
380ms httpd.service
347ms boot.mount
311ms tuned.service
245ms lvm2-monitor.service
237ms libvirtd.service
232ms accounts-daemon.service
203ms systemd-vconsole-setup.service
203ms ModemManager.service
168ms avahi-daemon.service
167ms systemd-logind.service
156ms rtkit-daemon.service
127ms chronyd.service
```

# Targets are the new Runlevels

Targets != Runlevels – some equivalency

Traditional Runlevel	Equivalent Target	Symlink Target
Runlevel 0	poweroff.target	runlevel0.target
Runlevel 1	rescue.target	runlevel1.target
Runlevel 2	multi-user.target	runlevel2.target
Runlevel 3	multi-user.target	runlevel3.target
Runlevel 4	multi-user.target	runlevel4.target
Runlevel 5	graphical.target	runlevel5.target
Runlevel 6	reboot.target	runlevel6.target

- Targets can and will contain other targets

# Common Targets

Target	Purpose
graphical.target	Supports multiple users, graphical and text-based logins
multi-user.target	Supports multiple users, text-based logins only
rescue.target	Single user, local file systems mounted and basic system initialization completed, networking is not activated
emergency.target	Single user, root file system is mounted read-only, only a few essential services are started, networking is not activated

- Rescue and Emergency require root password!

# Working with Targets

Viewing the default target:

```
[root@rhel7 ~]# systemctl get-default
multi-user.target
[root@rhel7 ~]#
```

Setting default target:

```
[root@rhel7 ~]# systemctl set-default graphical.target
rm '/etc/systemd/system/default.target'
ln -s '/usr/lib/systemd/system/graphical.target' '/etc/systemd/system/default.target'
[root@rhel7 ~]#
```

Default target is just a symlink:

```
[root@rhel7 ~]# ls -al /etc/systemd/system/default.target
lrwxrwxrwx. 1 root root 40 Feb 22 21:17 /etc/systemd/system/default.target -> /usr/lib/systemd/system/graphical.target
[root@rhel7 ~]#
```

# Working with Targets

Changing currently loaded target:

```
[root@rhel7 ~]# systemctl isolate graphical.target  
[root@rhel7 ~]#
```

Changing to rescue mode:

```
[root@rhel7 ~]# systemctl rescue  
  
Broadcast message from mruzicka@rhel7.mruzicka on pts/0 (Sat 2015-02-14 19:48:43  
EST):  
  
The system is going down to rescue mode NOW!
```

Changing to emergency mode without sending message:

```
[root@rhel7 ~]# systemctl --no-wall emergency  
█
```

# Working with Targets

View list of currently loaded targets:

```
[root@rhel7 ~]# systemctl list-units --type target
```

Results pipe to less by default: (can use --no-pager)

```
UNIT                                LOAD    ACTIVE SUB    DESCRIPTION
basic.target                        loaded active active Basic System
cryptsetup.target                   loaded active active Encrypted Volumes

/system.slice/auditd.service	1	-	-	-	-
/system.slice/avahi-daemon.service	2	-	-	-	-

- May need to enable accounting – perfect

```
[root@rhel7 ~]# vi /etc/systemd/system/mariadb.service.d/accounting.conf
```

```
[Service]
CPUAccounting=1
MemoryAccounting=1
BlockAccounting=1
```

# systemd-cgls

Recursively show control group contents:

```
[root@rhel7 ~]# systemd-cgls █
```

```
├─1 /usr/lib/systemd/systemd --switched-root --system --deserialize 23
├─user.slice
│   └─user-1000.slice
│       └─session-2.scope
│           ├── 311 -bash
│           ├── 2830 sshd: mruzicka [priv
│           ├── 2866 sshd: mruzicka@pts/1
│           └─2867 -bash
```

```
├─system.slice
│   ├── systemd-locale.service
│   │   └─1810 /usr/lib/systemd/systemd-locale
│   ├── colord.service
│   │   └─1644 /usr/libexec/colord

│   │   └─1145 /usr/libexec/upowerd
│   └─polkit.service
│       └─680 /usr/lib/polkit-1/polkitd --no-debug
```

# systemd Logging: journalctl

# Improved Logging

- Don't need to wait for syslog to start
- No More Losing STDERR and STDOUT
- More detail than classic syslog alone
- Logging with metadata
- Improved debugging and profiling

# journalctl

- Does not replace rsyslog in RHEL 7
  - rsyslog is enabled by default
- The journal is not persistent by default.
  - Enable persistence: ``mkdir /var/log/journal``
- Stored in key-value pairs
  - `journalctl [tab] [tab]`
  - Man 7 `systemd.journal-fields`
- Collects event metadata along with the message
- Simple to filter
  - Interleave units, binaries, etc.

# Using the Journal

- Tail the journal: ``journalctl -f``
- Show X number of lines: ``journalctl -n 50``
- View from boot: ``journalctl -b``
- Filter by priority: ``journalctl -p [level]``

0	emerg
1	alert
2	crit
3	err
4	warning
5	notice
6	debug

# journalctl

## View basic logs:

```
[root@rhel7 ~]# journalctl
-- Logs begin at Tue 2015-02-17 17:56:24 EST, end at Tue 2015-02-17 22:01:01 EST
Feb 17 17:56:24 rhel7.mruzicka systemd-journal[90]: Runtime journal is using 6.2
Feb 17 17:56:24 rhel7.mruzicka systemd-journal[90]: Runtime journal is using 6.2
Feb 17 17:56:24 rhel7.mruzicka kernel: Initializing cgroup subsys cpuset
Feb 17 17:56:24 rhel7.mruzicka kernel: Initializing cgroup subsys cpu
Feb 17 17:56:24 rhel7.mruzicka kernel: Initializing cgroup subsys cpuacct
Feb 17 17:56:24 rhel7.mruzicka kernel: Linux version 3.10.0-229.el7.x86_64 (mock
Feb 17 17:56:24 rhel7.mruzicka kernel: Command line: BOOT_IMAGE=/vmlinuz-3.10.0-
```

- Time stamps converted to system local time zone
- All logged data is shown, including rotated logs
- Non-persistent by default, can be preserved

# journalctl

View most recent logs: (-f to follow)

```
[root@rhel7 ~]# journalctl -n 10
-- Logs begin at Tue 2015-02-17 17:56:24 EST, end at Tue 2015-02-17 22:05:37 EST
Feb 17 22:00:21 rhel7.mruzicka dbus[623]: [system] Successfully activated service
Feb 17 22:01:01 rhel7.mruzicka systemd[1]: Created slice user-0.slice.
Feb 17 22:01:01 rhel7.mruzicka systemd[1]: Starting Session 37 of user root.
Feb 17 22:01:01 rhel7.mruzicka systemd[1]: Started Session 37 of user root.
Feb 17 22:01:01 rhel7.mruzicka CROND[24501]: (root) CMD (run-parts /etc/cron.hou
Feb 17 22:01:01 rhel7.mruzicka run-parts(/etc/cron.hourly)[24507]: starting 0ana

Feb 17 22:01:01 rhel7.mruzicka run-parts(/etc/cron.hourly)[24515]: starting 0yum
Feb 17 22:01:01 rhel7.mruzicka run-parts(/etc/cron.hourly)[24519]: finished 0yum
Feb 17 22:05:37 rhel7.mruzicka [24590]: blah blah blah
```

- Can force stdout/stderr to write to journal with `systemd-cat` if wanted

```
[root@rhel7 ~]# systemd-cat echo 'blah blah blah'
```

# journalctl

Filter by priority:

```
[root@rhel7 ~]
-- Logs begin
Feb 17 17:56:2
Feb 17 17:56:2
```

```
22:10:01 EST
(MSR c1 is 0
generators/an
```

Filter by

```
[root@rhel7 ~]
7 18:10:00"
-- Logs begin
Feb 17 18:00:5
Feb 17 18:00:5
```

```
til "2015-2-1
22:10:01 EST
pawning /usr/
rvice.
```

- Advanced filtering by field, UID, unit, etc..

# Using journalctl

- Other useful filters:
  - -r reverse order
  - -u [unit]
  - binary e.g. /usr/sbin/dnsmasq [additional binaries]
  - --since=yesterday or YYYY-MM-DD (HH:MM:SS)
  - --until=YYYY-MM-DD
- View entire journal
  - journalctl -o verbose (useful for grep)

# systemd - Review

# Review: systemd

- Replaces init and does much more
- It is here and it's powerful
- New boot and root password reset process
- New commands and functionality
- Plenty of great information and resources available

# Start using the new commands

Bash Completion is your friend!

- # yum install bash-completion

# Compatibility

- Systemd maintains 99% backwards compatibility with LSB compatible initscripts and the exceptions are well documented.
- While we do encourage everyone to convert legacy scripts to service unit files, it's not a requirement.
- Incompatibilities are listed here:  
<http://www.freedesktop.org/wiki/Software/systemd/Incompatibilities/>
- Converting SysV Init Scripts:
