Subject vs Service Orientation

Subject-Oriented Clouds

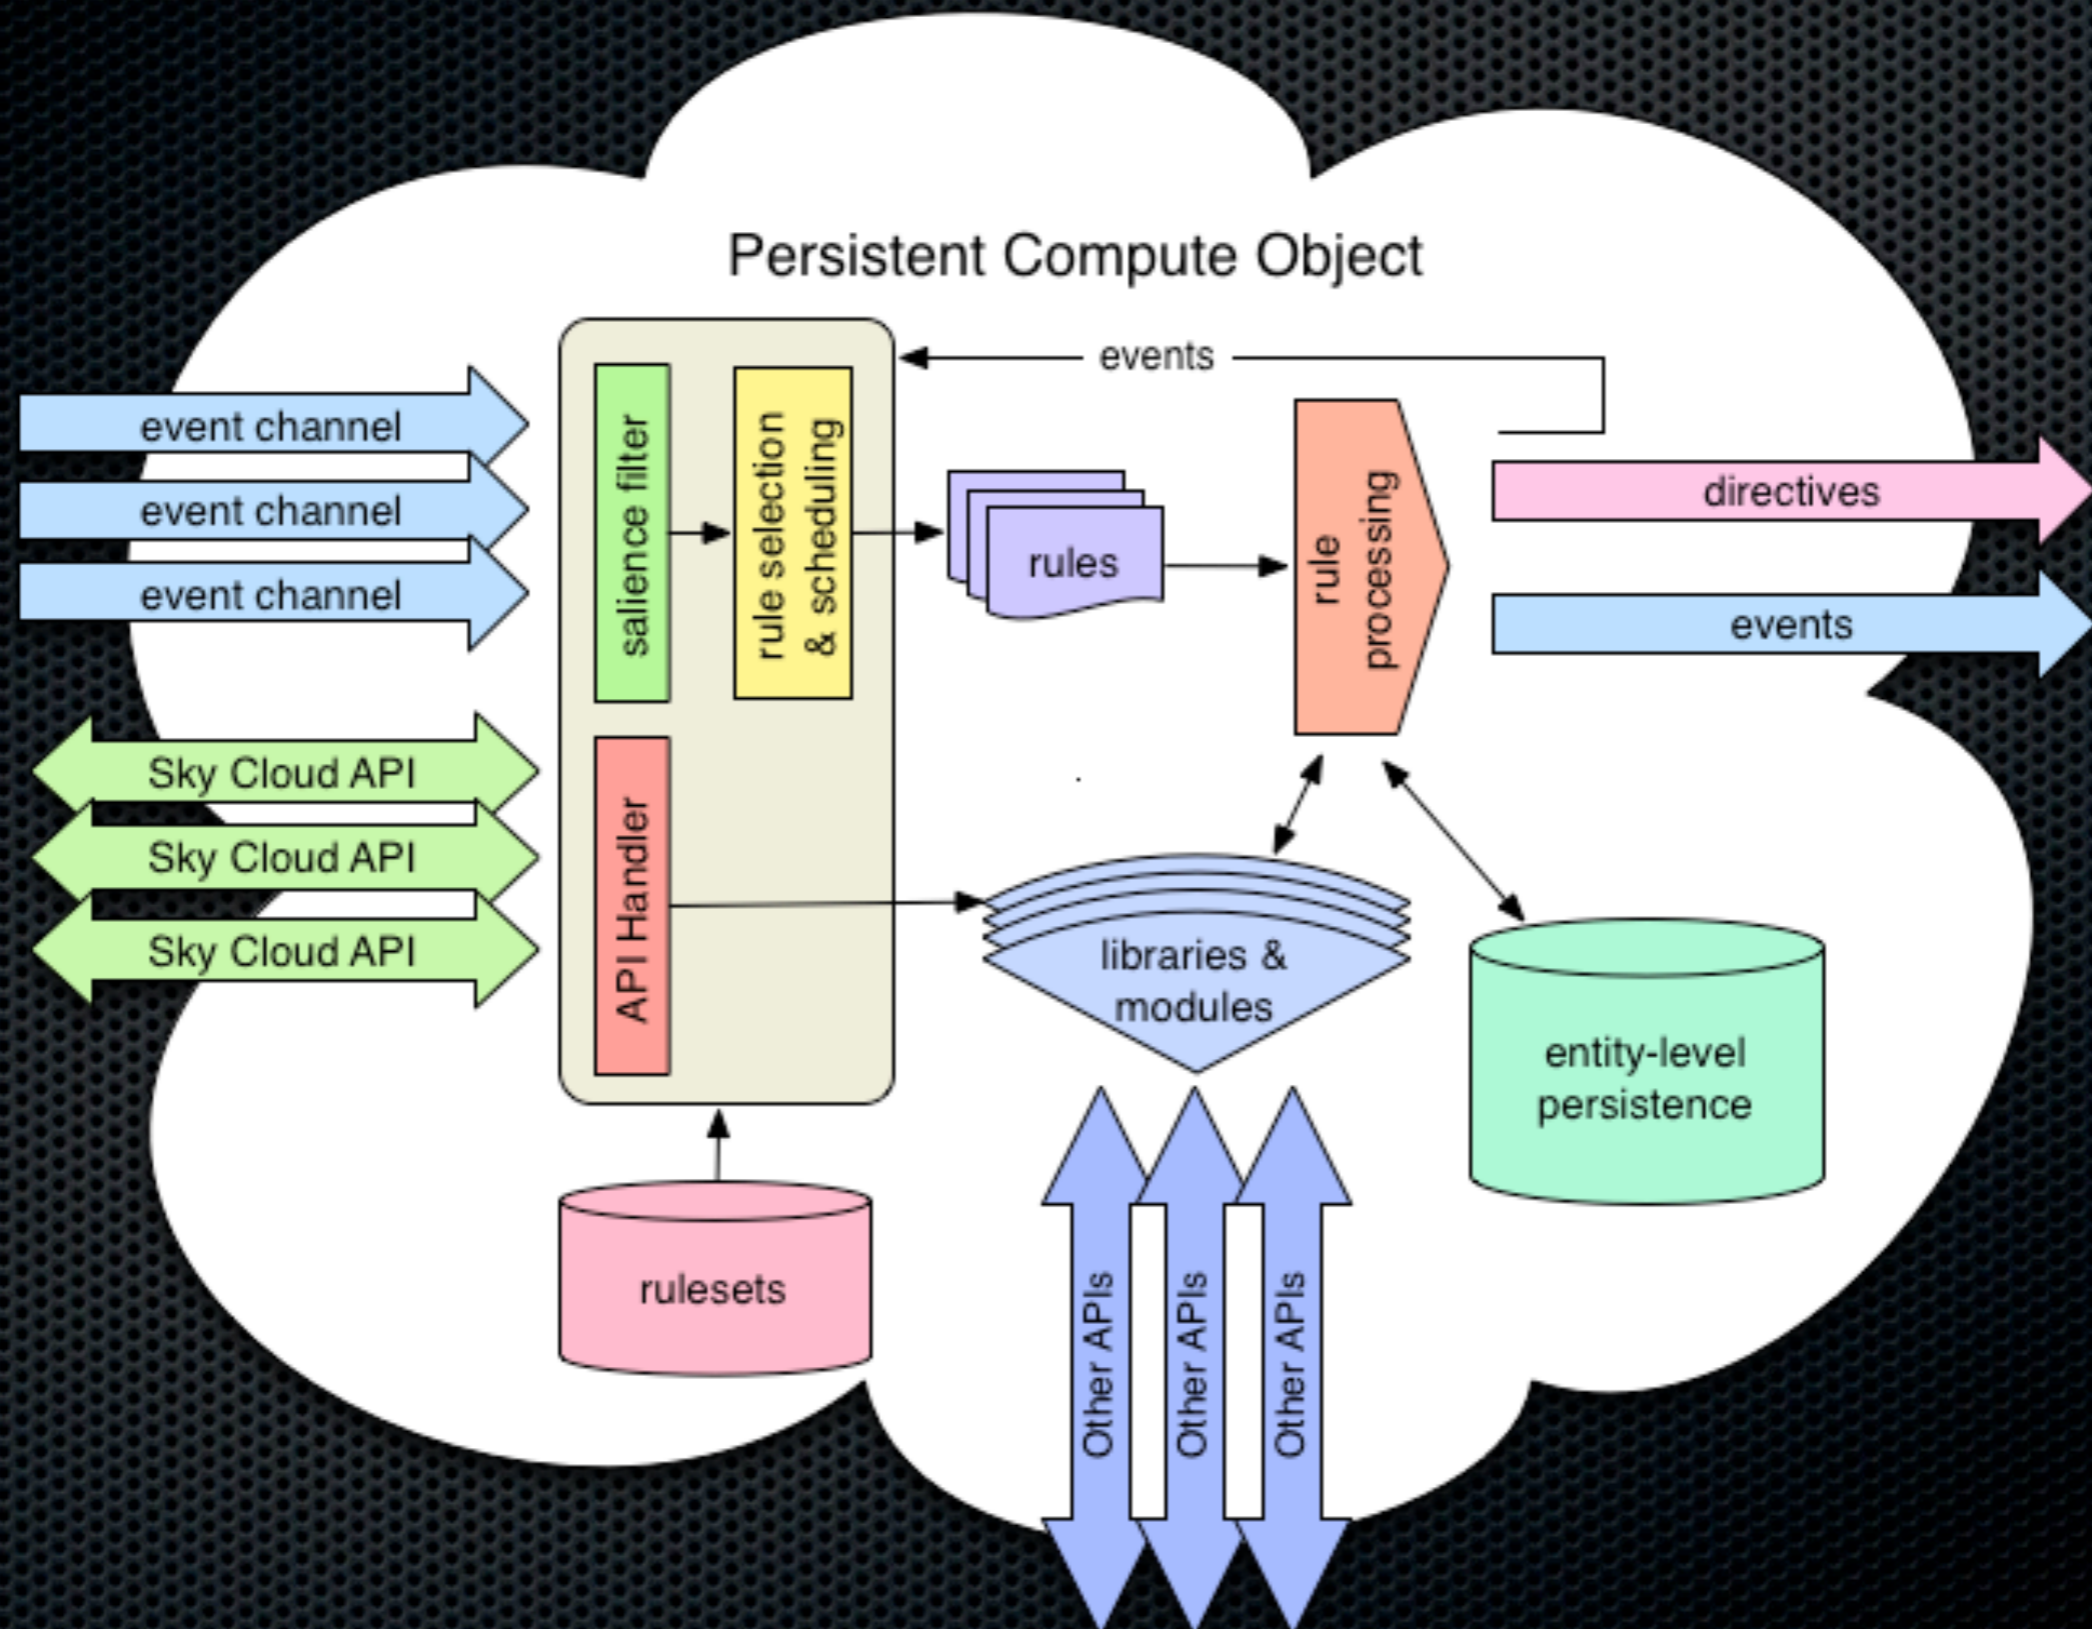

via Johannes Ernst

My personal cloud is formed
by a constellation of
persistent computational
objects -- picos

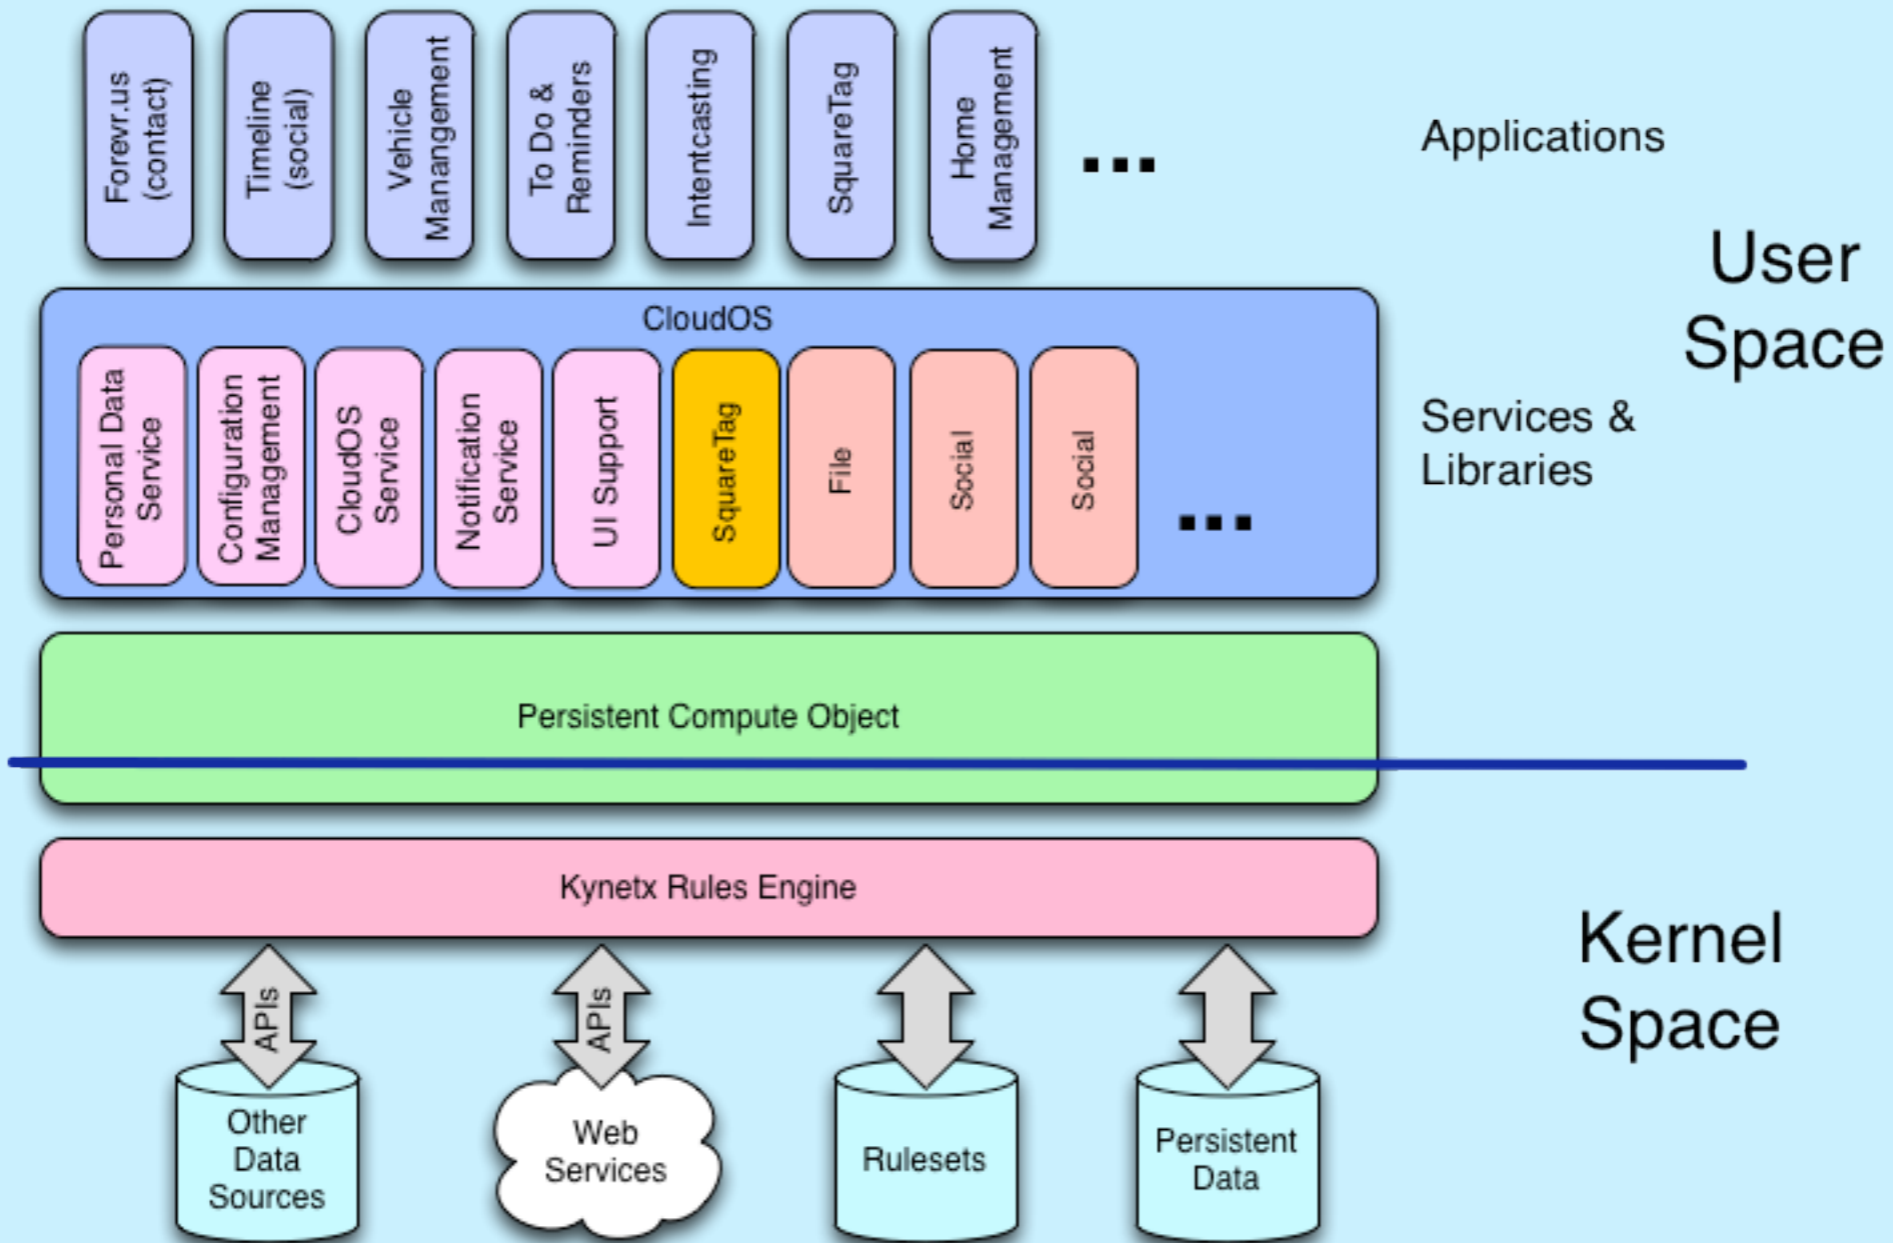

Picos are online computers

- ✦ **Identity**—they represent a specific entity
- ✦ **Storage**—they persistently encapsulate both structured and unstructured data
- ✦ **Open event network**—they respond to events
- ✦ **Processing**—they run applications autonomously
- ✦ **Event Channels**—they have connections to other picos
- ✦ **APIs**—they provide access to and access other online services

Picos Internals

Picos Are Part of Stack

Picos Are Decentralized & Networked

Space

OOP for the Cloud

Picos Ease Modeling

Mirror Worlds

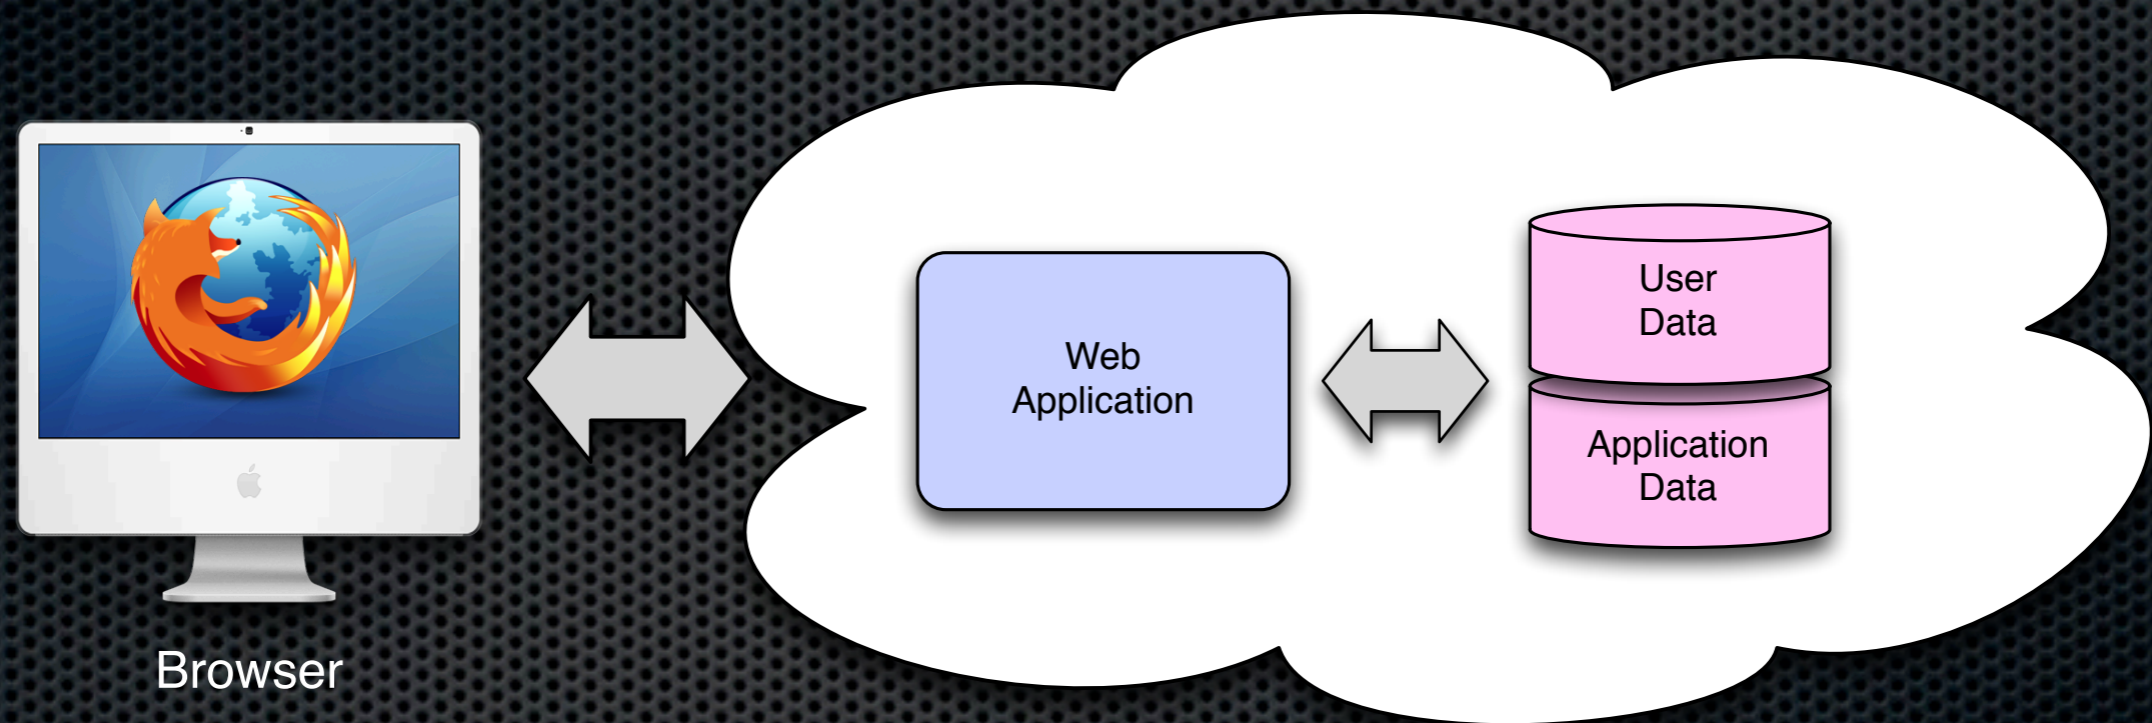

- ✦ Blogs
- ✦ Cloud Index
- ✦ Fuse
- ✦ Potholes

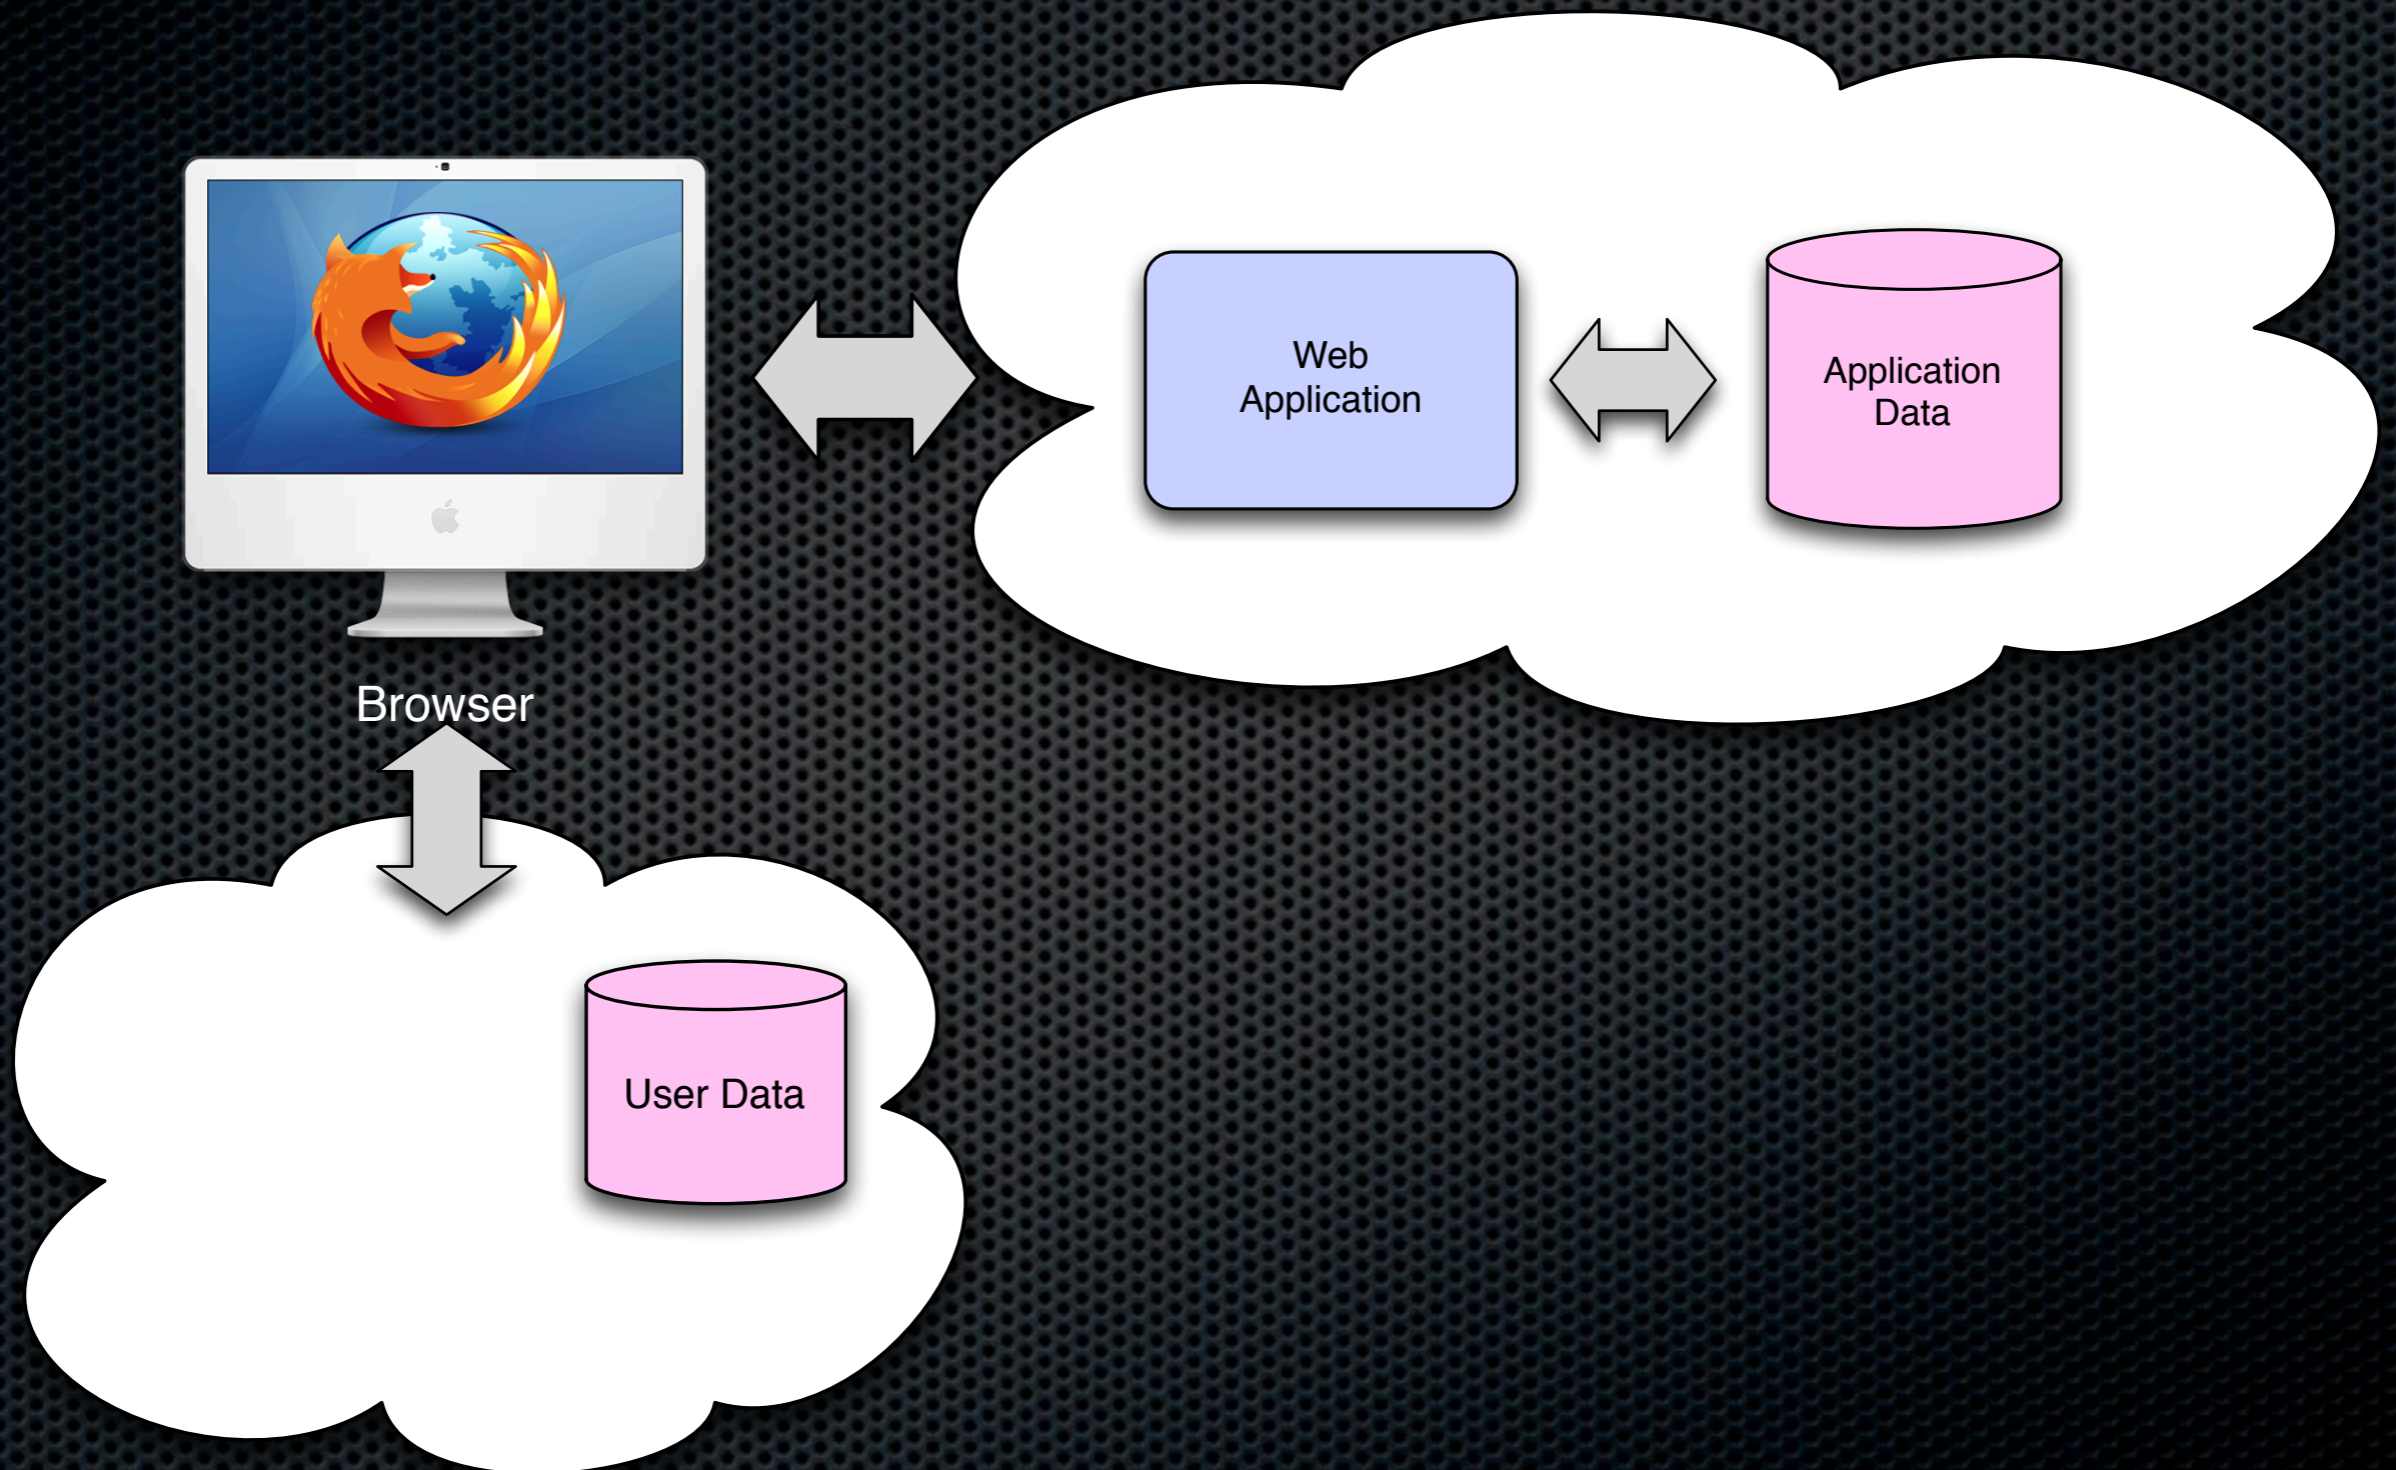

{ David Gelernter in Berlin's Renaissance Theater }

Picos support a brand new
programming model

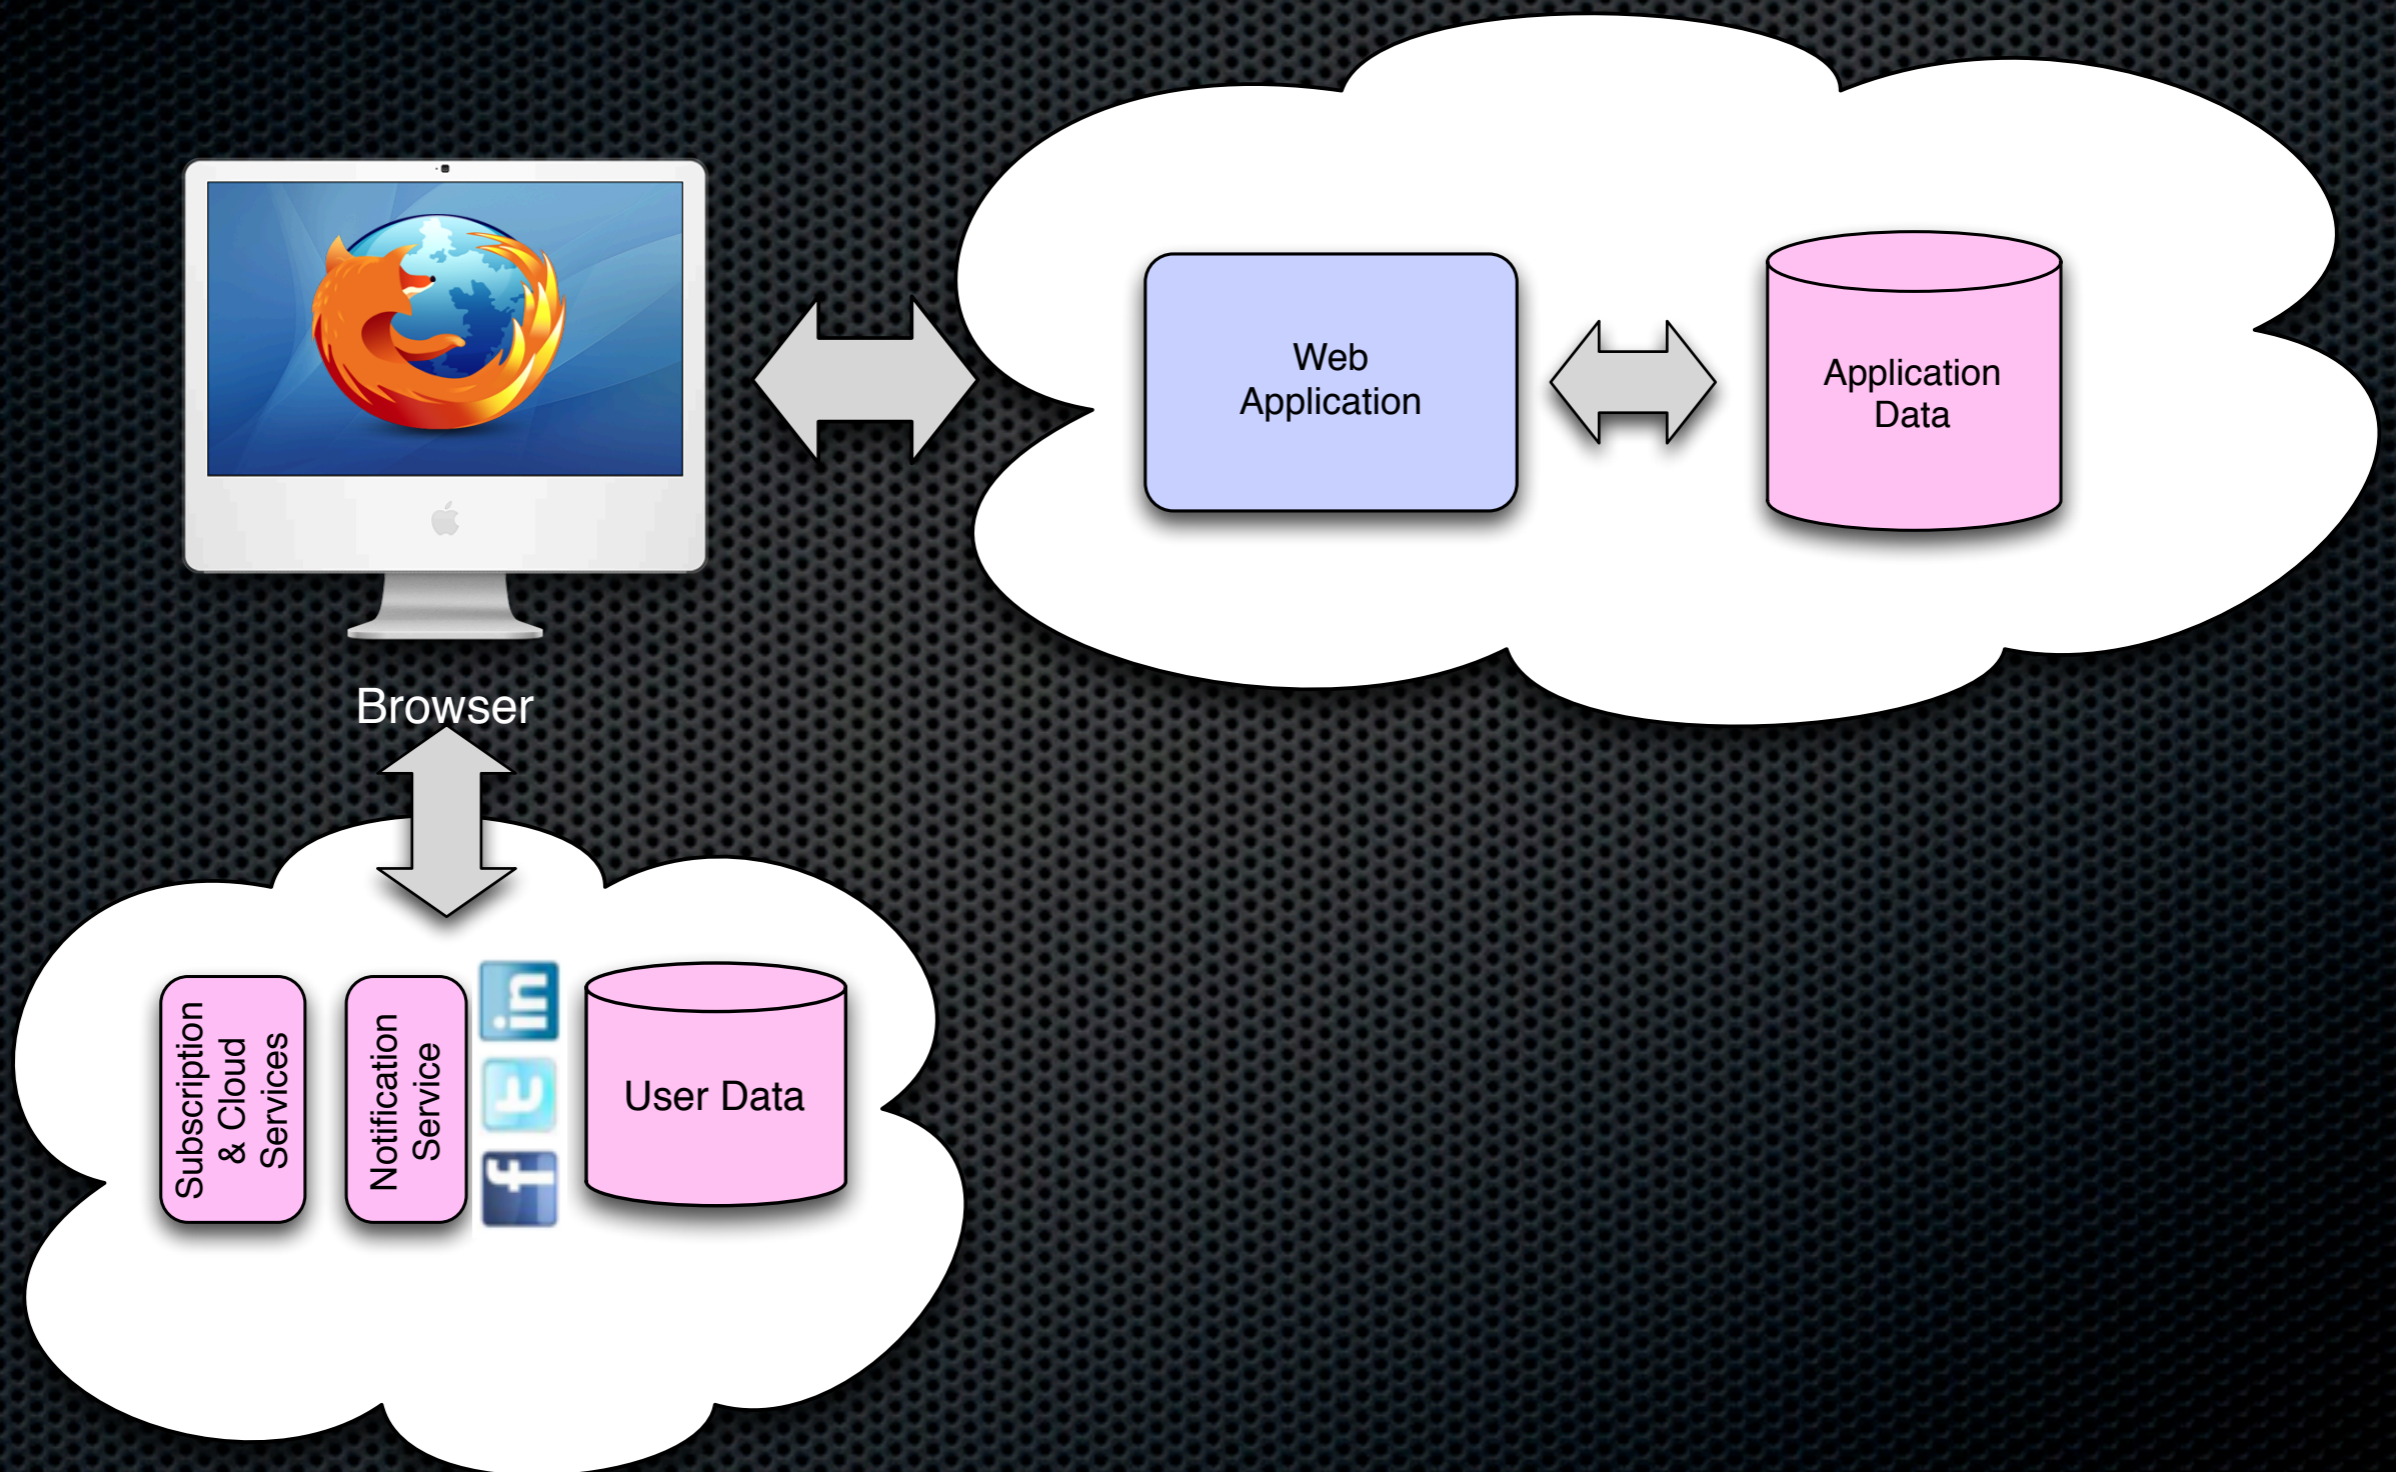

Web 2.0 Business Models

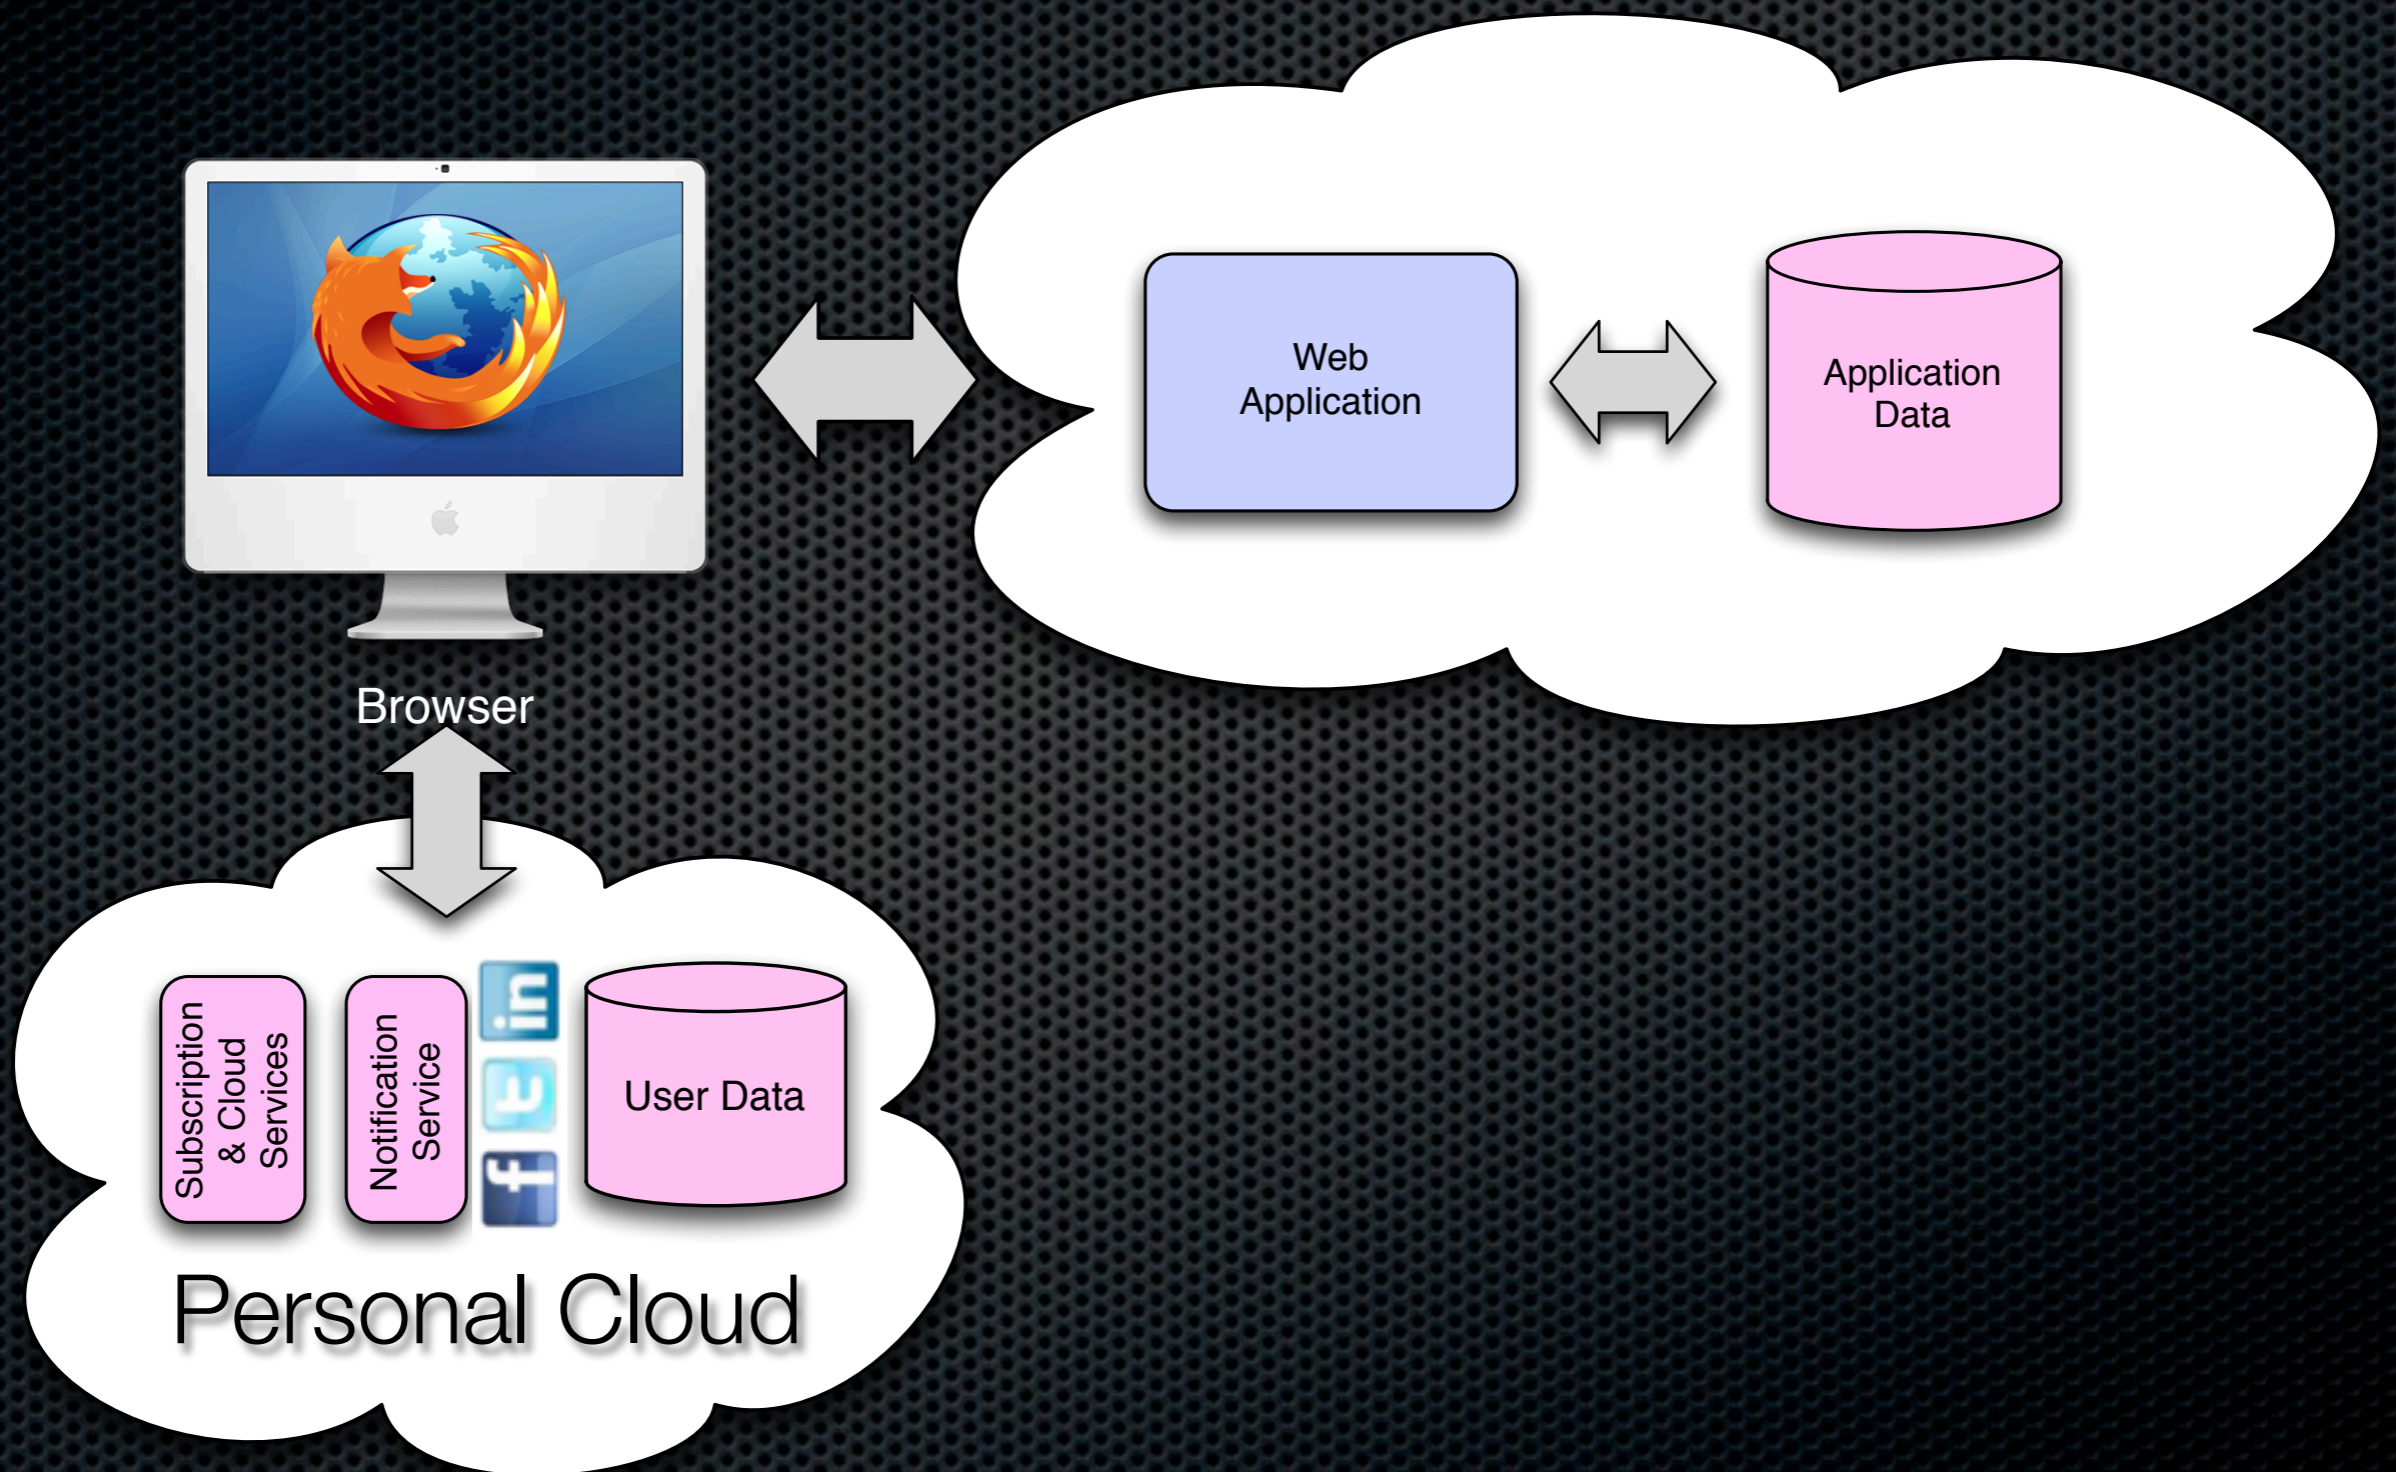

A New Model

A New Model

A New Model

Why do this?

- ✦ Orthogonality and modularity are powerful: network effects!
- ✦ More flexible
- ✦ Less work
- ✦ Less expensive

Challenges

- ✦ Identity
- ✦ Trust
- ✦ Schemas
- ✦ Performance
- ✦ Features
- ✦ Security

We're looking for a few hardy
developers right now!
